

Sample Ingest Payload

Companion to Ingest Payload Contract v1.2

VERSION	1.1
Date	August 2026
Author	Maria Azevedo
Companion to	Ingest Payload Contract v1.2

One fully populated request body for POST /webhooks/runpod_ocr_results, provided so the importer can be built and tested against a concrete example.

All names, identifiers, addresses, and amounts in this document are invented. The record structure reflects a typical certification packet; the data does not correspond to any resident, property, or case.

The example exercises every path: a two-member household, one member with paystubs and a verification of income, one member with a zero-income affidavit, an asset with both statements and a VOA, an asset whose type collapses to other, an expense record, a finding carrying a checklist item_code, and findings at three different subject levels.

Request

```
POST /webhooks/runpod_ocr_results HTTP/1.1
Host: cartograph.example.com
Content-Type: application/json
X-Timestamp: 1787059329

```

Expected response

HTTP/1.1 202 Accepted

```
{ "ok": true, "import_id": "imp_01JQ4XKQ9R3T5YVA7BND2MFH" }
```

Expected result callback

Posted by the background job to the engine once the import completes.

POST /integration/import_result

Notes for the implementer

- **ref values are scoped to this payload.** They carry no meaning outside the request and should not be persisted.
- **The four paystubs belong to one income record.** The engine extracts one entry per physical stub; grouping by member and employer happens engine-side, so the importer receives them already nested.
- **The second income record uses** `income_type: "other"` because `zero_income` is not a valid type. The meaning is carried by the `zero_income` child object.
- **Checklist determinations ride on findings.** A finding that answers a checklist item carries that item's `item_code`; findings not tied to an item omit the key. There is no separate checklist array, because `cert_review_checklist_items` was dropped on 2026-08-18.
- **Findings use three subject types:** income record, asset record, and case level (`file_review`, null subject). The importer resolves `subject_ref` against records created earlier in the same transaction.
- detail is **reviewer-facing internal guidance** and is not shown to clients.
- **The item code here is a placeholder.** Codes are per-program and editable, so they must be supplied rather than assumed. This also requires `item_code` on `cert_review_findings`, which does not exist yet.

- **Amount consistency in this example:** the four paystubs average 1,783.74 gross, which annualises at 26 periods to 46,377.18, matching `cert_review.annual_income`. The two asset balances sum to 3,362.55, matching `annual_assets`. Cartograph recomputes both from the child records; the values are included so the comparison can be verified.
