

Checklist Coverage Map

Engine capability against the CORE checklist codes

VERSION	1.0
Date	August 2026
Author	Maria Azevedo
Scope	The 41 CORE - codes applied to production 2026-08-26

What the audit engine can determine for each generic checklist item, and what each unanswered one needs. This is the specification for the checklist emitter.

Coverage is assessed against the engine's actual capabilities: its document classification taxonomy, its extraction schema, its signature validator, and its certification-type rules. It is not an estimate of what could be built.

1. Summary

COVERAGE	COUNT	MEANING
Auto	21	Answerable today from the packet alone
Partial	6	Answerable in most cases; some inputs missing or reviewer confirms
Needs reference data	5	Requires Cartograph's stored rent and income limits
Needs expense extraction	3	The engine extracts no expense data at all
Contested	1	Both systems compute it; authority already agreed
Reviewer only	5	Compliance judgments, not facts in the packet

27 of 41 are answerable today. Adding the reference-data comparison takes it to 32; adding expense extraction takes it to 35. The remaining 5 are programme and set-aside determinations that live in Cartograph, not in a certification packet, and should stay with the reviewer.

2. Three things that apply throughout

Signature items mean "present and dated", not "signed". The engine treats a form that is present but shows no signature as *unverifiable* rather than proven-missing. Handwritten signatures do not survive OCR, and text-level signature counting fired on 99% of cases with no correlation to reviewer rejections. Where a signature genuinely

must be confirmed, the engine performs a targeted vision check on that page.

Scope differs by item. Some are per-case, some per household member, some per income or asset record. The engine emits one finding per subject, so a six-member household produces six results for a member-scoped item.

Category is Cartograph's to resolve. Four labels appear under `file_review` at one community and `general_requirements` at another while sharing a code. The engine sends `item_code` and lets the template row determine the category.

3. Unit and rent (9 items)

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-UR-TENANTRENT	Auto	Tenant rent extracted from the certification form
CORE-UR-UAAPPLIED	Partial	Arithmetic check: gross rent = tenant rent + utility allowance
CORE-UR-UNITTYPE	Partial	Bedroom count extracted; needs the unit record to confirm
CORE-UR-RENTLIMIT	Reference data	Gross rent extracted. The authoritative limit is Cartograph's
CORE-UR-RENTCAP	Reference data	Same comparison as above, differently worded
CORE-UR-INCCAP	Reference data	Household income extracted. Income limit is Cartograph's
CORE-UR-UA	Reference data	Utility allowance extracted. Whether it is *current* needs the schedule
CORE-UR-SETASIDE	Reviewer only	Set-aside assignment lives in Cartograph, not the packet
CORE-UR-SETASIDETIER	Reviewer only	As above

This category was empty for CT 8-30G and is the one most changed by Cartograph storing rent and income limits per unit. Four of these become answerable the moment those values reach the engine.

CORE-UR-RENTLIMIT and CORE-UR-RENTCAP appear to be the same requirement worded twice. Worth confirming before the engine answers both from one check.

4. Household members (6 items)

Per member.

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-HHM-AGE	Auto	Date of birth extracted, cross-checked against the certification form
CORE-HHM-SSN	Auto	Identity document and social security card against the form's last four
CORE-HHM-STUDENT	Auto	Student flag from the certification form and questionnaire
CORE-HHM-STUDENTCERT	Auto	Student Status Certification classified, presence and date checked
CORE-HHM-9887	Auto	HUD 9887 and 9887-A classified; page counts validated per adult
CORE-HHM-CITIZEN	Partial	Citizenship Declaration classified, but only expected on HUD and USDA properties. Blank on LIHTC-only files rather than failed

5. Income (6 items)

Per income record.

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-INC-TYPE	Auto	Income type extracted per source
CORE-INC-PAYSTUBS	Auto	Paystub count and date span per employer
CORE-INC-PERIOD	Auto	Hire date, termination date, employment status, and paystub span
CORE-INC-3PVERIFY	Auto	Verification of income present for the source
CORE-INC-V0E	Auto	Same evidence as third-party verification
CORE-INC-ANNUALCALC	Contested	The engine computes annual income; Cartograph computes its own. Per the agreed rule Cartograph is authoritative and the engine raises material divergence as a finding rather than asserting the item

CORE-INC-3PVERIFY and CORE-INC-V0E resolve to the same evidence. Confirm whether they are meant to differ.

6. Assets (5 items)

Per asset record.

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-AST-STMT	Auto	Bank statement or verification of assets classified for the account
CORE-AST-BALANCE	Auto	Current balance against statement and verification values
CORE-AST-INCCALC	Auto	Income from asset extracted
CORE-AST-PASSBOOK	Partial	The engine determines whether household assets exceed \$5,000; applying the passbook rate is Cartograph's calculation
CORE-AST-IMPUTE	Partial	As above. The engine can flag assets over threshold with no imputed income

7. General requirements and file review (12 items)

Per case.

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-GEN-TIC	Auto	TIC classified, signature date extracted, vision-verified
CORE-GEN-9887	Auto	HUD 9887 and 9887-A classified, page counts validated per adult
CORE-GEN-9200	Auto	HUD 92006 classified and date-checked
CORE-GEN-RACEETH	Auto	Race and Ethnic Data form classified per member
CORE-GEN-LEASE	Auto	HUD Model Lease classified
CORE-GEN-PRIORCERT	Auto	Previous certification extracted when present in the packet
CORE-GEN-APPSIGNED	Auto	Application classified, signature date extracted, adult count known
CORE-GEN-CERTPERIOD	Partial	Effective date extracted; confirming the period is *correct* needs the expected schedule
CORE-GEN-INCLIMITS	Reference data	Needs Cartograph's income limits for the certification year

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-GEN-8823	Reviewer only	IRS 8823 and 9001 reporting is a compliance judgment, not a document fact
CORE-GEN-SETASIDE	Reviewer only	Set-aside confirmation lives in Cartograph
CORE-GEN-SETPCT	Reviewer only	As above

CORE-GEN-9200 is labelled "Form 92006". If the code is meant to read 92006, better corrected before anything depends on it.

8. Expenses (3 items)

CODE	COVERAGE	BASIS, OR WHAT IS MISSING
CORE-EXP-AMOUNT	Not extracted	The engine extracts no expense data
CORE-EXP-ELIGIBLE	Not extracted	As above
CORE-EXP-DOCS	Not extracted	As above

These are live at five communities and will return blank on every case until expense extraction exists. Medical, dependent-care, and disability-assistance deductions affect adjusted income on HUD certifications, so this is a real gap rather than a cosmetic one.

9. What unlocks the remaining items

- Rent and income limits reaching the engine.** Unlocks 5 items and improves 3 more. Whether they arrive in the trigger payload or through a lookup is an open question; the trigger is simpler.
- Expense extraction.** Unlocks 3 items. New extraction work.
- The unit record** (bedroom count, set-aside). Improves CORE-UR-UNITTYPE and would move the two set-aside items out of reviewer-only, though those may be better left with a human.

10. Open questions

- CORE-UR-RENTLIMIT and CORE-UR-RENTCAP appear to be the same requirement.
- CORE-INC-3PVERIFY and CORE-INC-VOE resolve to the same evidence.
- Should CORE-INC-ANNUALCALC be answered by the engine at all, given Cartograph computes the authoritative figure?

- 1 Confirm the engine sends `item_code` only and Cartograph resolves category.
- 2 CORE-GEN-9200 versus 92006.
